**Integrative
Structural Biology
and
Drug Design**

Bimonthly seminar series open to all interested PhD students and postdocs

Drug Development: Past, Present & Future

The first use of drugs for medical and recreational reasons reaches back to the roots of humans. In this first talk of our seminar series **struc2drug**, we will give a brief overview of the usage of healing substances ranging from **ancient Egypt**, over the first identification of active compounds in the **18th century** to **modern drug discovery strategies**.

We will introduce the **main steps of drug development**, including computational and experimental methods, which will serve as topics for future talks in this seminar series. Additionally, we invite you to **discuss with us** your expectations and interests regarding topics and methods to be covered.

Event Information
